

Pairs with given sum II

Problem Description

Given a sorted array of integers (not necessarily distinct) A and an integer B , find and return how many pair of integers $(A[i], A[j])$ such that $i \neq j$ have sum equal to B .
Since the number of such pairs can be very large, return number of such pairs modulo $(10^9 + 7)$.

Problem Constraints

$1 \leq |A| \leq 100000$

$1 \leq A[i] \leq 10^9$

$1 \leq B \leq 10^9$

$N = 10^5$
 $O(N^2)$
 $(10^5)^2 \rightarrow 10^{10}$ iterations
 $1 \text{ sec} \rightarrow 10^8 \text{ it, on an average}$

Input Format

The first argument given is the integer array A .

The second argument given is integer B .

Output Format

Return the number of pairs for which sum is equal to B modulo $(10^9 + 7)$.

$arr[7] = \{1, 2, 2, 4, 5, 6, 7\}, B = 7$
 $1 + 6 \rightarrow 0 \& 5$
 $6 + 1 \rightarrow 5 \& 0$
 $\left. \begin{array}{l} 1 + 6 \\ 2 + 5 \\ 2 + 5 \end{array} \right\} 3$
2 elements

idea 1: 2 loops

count = 0, MOD = $10^9 + 7$

for ($i = 0$ $i < N$ $i++$) {
 for ($j = i + 1$ $j < N$ $j++$) {

$B - arr[i]$

if ($arr[j] == B - arr[i]$) {

count = (count + 1) % MOD

}

}

}

return count

for (i=0 i<N i++) {

if (map.containsKey
(B-ar[i]) {
count += map.get(B-ar[i])

}

return count/2

$$\underline{0} \quad \underline{0} \quad \checkmark$$

edge case:

$$\{ \underline{0} \quad \underline{1} \quad \underline{2} \quad \underline{3} \quad \underline{4} \quad \underline{5} \quad \underline{3} \}$$

$4 + 3 + 2 + 1 = 10$ pairs, $B=4$

$$ar[i] + ar[j] = B$$

2	5 4 5
3	1

	$B-ar[i]$	count
i=0	2	4
i=1	2	4
i=2	2	4
i=3	2	4
i=4	2	4
i=5	1 X	

$$\underline{20}$$

$$20/2 = 10$$

Implementing this code :-

```
for (i = 0; i < N; i++) {
```

```
    if (map.containsKey  
        (B - ar[i])) {
```

```
        if (ar[i] != B - ar[i]) {  
            count += map.get(B - ar[i])
```

```
        } else {
```

```
            c = map.get(B - ar[i])
```

```
            map.put(B - ar[i], c + 1)
```

```
            count += map.get(B - ar[i])
```

```
            map.put(B - ar[i], c + 1)
```

```
        }  
    }
```

```
}
```

```
return count / 2
```

TC: $O(N)$

SC: $O(N)$

Search in Bitonic Array!

Problem Description

Given a bitonic sequence **A** of **N** distinct elements, write a program to find a given element **B** in the bitonic sequence in **$O(\log N)$** time.

NOTE:

- A Bitonic Sequence is a sequence of numbers which is first strictly increasing then after a point strictly decreasing.

Problem Constraints

$$3 \leq N \leq 10^5$$

$$1 \leq A[i], B \leq 10^8$$

Given array always contain a bitonic point.

Array A always contain distinct elements.

Input Format

First argument is an integer array **A** denoting the bitonic sequence.

Second argument is an integer **B**.

Output Format

Return a single integer denoting the position (0 index based) of the element **B** in the array **A** if **B** doesn't exist in **A** return -1.

$$ar[7] = \{ \begin{matrix} 0 & 1 & 2 & 3 & 4 & 5 & 6 \\ 3, & 9, & 10, & 20, & 17, & 5, & 1 \end{matrix} \}$$

$B = \underline{20}$

↑

$$\Rightarrow 3$$

$$B = 15$$
$$\Rightarrow -1$$

bitonic point / index
